
A, reference reconstruction of all 1,050 chr21 CDS transcripts. B, distribution of CDS length differences. C, terminal-stop status across 121,766 Ensembl 109 CDS records; 18,559 of the 21,954 no-stop records carry mRNA_end_NF.

98 protein differences are confined to partial 3′ models; the underlying CDS nucleotides are identical.

+3 bp is the stop codon added to the CDS; +1/+2 bp are 5′ partial-model N pads. Both are reconstructed explicitly.

terminal TAA/TAG/TGA

no terminal stop
